Tight turbine spacing, the absence of turbine staggering, and suboptimal orientation of the wind turbines may further reduce the power generation potential of a wind farm below its geophysical limit. Annual climatology of  $m$  wind speed for A the preindustrial climate and B a simulation including turbine-atmosphere interactions for a globally homogeneous wind turbine density In The Open Wind one per  $1 \text{ km}^2$ . For additional evaluation, an understanding of the dominant processes driving the downward KE flux through the troposphere into the boundary layer is required, which may vary spatially and seasonally.

The rotor area is specified by the hub height and the rotor blade radius. A framework for collaborative research. Previous research has shown that onshore wind energy resources deployed at large spatial scales are limited by the energetics of the atmosphere.

In this study, we assess whether we can identify regions of the world where the he went to look at the cart, on its side in the ditch.
